

Nitrogen in the Environment

NKnowledge® Technical Workshop

For

Environmental Technical, Research,
Advisory, Science & Academic
Professionals

By ENVIROKNOWLEDGE®

7-8 April, 2016 Hamilton, 11-12 April 2016 Palmerston North

And 14-15 April Christchurch

Seize the opportunity to revolutionise and advance your knowledge in *Nitrogen in the Environment* (N processes in soil, freshwater, marine water and wastewater) with a 2-full day technically intensive and interactive workshop (no assignments or tests).

The workshop contents and the extensive 100 page technical NKnowledge® manual researched and shared by Dr Selva Selvarajah (visit www.researchgate.net for profile) will be based on the most recent international research, challenging, of very high quality and technically complex yet extremely useful for all budding and well established and experienced Environmental Technical and Research/Science Professionals dealing with N in the environment (e.g. soil & water scientists, hydrogeologists, environmental consultants, wastewater engineers, fertiliser/nutrient management specialists, modellers and advisers, academics including postgraduate students and environmentalists).

ENVIROKNOWLEDGE® 3 Dunrobin Street, Dunedin 9013 Phone 03 4776111 www.enviroknowledge.co.nz

Unlike the conventional chemical and basic biological approach to N processes, the workshop takes a radical and sensible approach to deciphering complex N processes by analysing complex microbial processes in soil, water (fresh & marine) and wastewater. Two similar 3-day workshops held last year received excellent feedback. To attract busy professionals, it has been condensed now to 2-full days by retaining the full contents of the previous 3-day workshops.

Why should you know more about N in the environment?

- N is one of the most contentious water contaminants;
- Basic or textbook knowledge in N is no longer useful to manage, monitor or research water quality and soil-N effectively;
- Knowledge of N in a single medium (e.g. soil, groundwater or surface water) is not conducive to collaborative and effective research and management of N ;
- Poor decisions on N management or limits in consents and planning based on basic knowledge or poor source of information could cost the regions heavily;
- Advanced and comprehensive N knowledge will change technical experts' approach to investigating, researching, monitoring, teaching and reporting N process in soil and water;
- It will widen N knowledge of scientists and researchers who work in narrow disciplines (e.g. gaseous N losses, leaching, plant uptake, water quality);
- It will enable better understanding, appreciation and critical analysis of the quality of wider N research papers, technical reports, conference presentations and AEEs;
- It will enable understanding of the nutrient models, their limitations and applications better;
- It will be a confidence booster for field advisers in fertiliser/nutrient/pollution management

If you wish to explore/debate a refreshing approach to understanding N dynamics in the environment, please register your interest to attend with your full name, employer name and position by 23 March 2016 at sustain@enviroknowledge.co.nz .

Registration of interest closing date:	23 March 2016
Workshop confirmation by ENVIROKNOWLEDGE®:	24 March 2016
Daily workshop time:	9.00 am to 5.00 pm
¹Workshop fee/person:	\$1175.00 (excl GST)

Workshop	Hamilton	Palmerston North	Christchurch
Technical 2-Day	7-8 April 2016	11-12 April 2016	14-15 April 2016

¹Workshop fee: Includes lunch, tea/coffee, hardcopy manual and 3-month clarification support on workshop contents. **Reduced fee of \$850 (excluding GST) for current postgraduate students.**

Table of contents 2-Day Nitrogen in the Environment NKnowledge® Workshop

1. Nitrogen basics
2. N processes (outline)
3. Can we understand the complex N dynamics in the environment without understanding microbiology and microbial metabolisms?
 - a. Types of microbes
 - b. Why energy generations and use by microbes are important in the context of N dynamics?
 - c. Why are sources of microbial energy and carbon important?
 - d. Are microbial energy generation processes well understood?
4. Soil, water and wastewater are different microbial environments
 - a. Soil
 - b. Freshwater
 - i. River and stream
 - ii. Lakes
 - iii. Groundwater
 - c. Marine water
 - d. Wastewater
5. Why and how microbes use N in their metabolisms – the ‘mystery’ of N immobilisation or assimilation process?
 - a. Microbial absorption does not involve just NH_4 and NO_3
 - b. Does N immobilisation process deserve the ‘black box’ approach by the experts and N modellers?
6. Why would microbes mineralise N?
 - a. Wastewater engineers see mineralisation-immobilisation as digestion
 - b. What are the microbial metabolic reasons for high mineralisation in soils under aerobic conditions?
 - c. Mineralisation in aquatic ecosystems
7. C:N ratio is a supportive information to explain microbial behaviour
 - a. Soil
 - b. Water
 - c. Wastewater
8. Why and how microbes oxidise NH_4 to NO_3 (nitrification)?
 - a. Globally, could archaea be considered as a formidable force in nitrification process than bacteria?
 - b. Are we on the right track in the assessment of nitrification in soils?
 - c. Can NO_3 found in water come from nitrification in water?
 - d. Why nitrification remains as a wastewater engineer’s challenge?
9. Why microbes resort to denitrification?
 - a. Is it all about bacterial denitrification?
 - b. Is NZ lagging behind denitrification research and understanding?
 - c. Is N attenuation in freshwater well captured in NZ?
 - d. Could NZ’s wastewater treatment processes benefit from world’s advancements in denitrification research and technology?

10. Should we be satisfied by just quantifying biological N fixation?
 - a. What is so unique about the N fixing enzyme nitrogenase?
 - b. Does it have to be a legume to fix N in soils?
 - c. What makes cyanobacteria the most successful N fixer?
11. Have soil scientists yet understood the driving force behind ammonia volatilisation?
12. Should we continue to ignore N deposition in NZ?
13. Are we on the right track in NO₃ leaching research?
 - a. Charges in soil
 - b. Soil water
 - c. Sources of NO₃
 - d. What is the biological probability for NO₃ leaching?
 - e. Limitations to field leaching measurements and estimates
14. Is plant uptake of N taken for granted?
 - a. Ammonium
 - b. Nitrate
 - c. Dissolved organic nitrogen
15. Do we know enough about algal blooms?
 - a. Is chlorophyll *a* sufficient to manage algal blooms?
 - b. Do cyanobacteria deserve better attention?
16. N:P ratios and their effects in water
17. Wetlands are efficient N mitigation tools but have limitations in attenuating or treating N
 - a. Natural
 - b. Constructed
18. Do riparian N processes deserve their profile in N mitigation?
19. Can organic farming be a good N mitigation tool?
20. How do other N mitigation tools such as wintering cows in barns stack up?
21. Is ¹⁵N stable isotope a reliable tool in tracking sources of N pollution?
22. How much can we rely on existing NZ N models?
23. Should we blame the methods of assessing N processes or the way of reporting?
24. Are NZ scientific and technological research on N and regional council N monitoring on the right track?
 - a. Can we continue to rely on NZ research to understand N dynamics properly?
 - b. Is regional council monitoring of N in the environment sufficient?
 - c. Should councils continue as an N monitoring agency or be involved in specific N research as well?
25. Are we publishing for the sake? - quality vs quantity.
 - a. How can we produce better regional council SOE reports?
 - b. Are all refereed journal scientific articles reliable?
 - c. How to review refereed journal scientific articles critically and use the information sensibly?
